Cat - Wikipedia

Cats have excellent night vision and can see at only one-sixth the light level required for human vision This is partly the result of cat eyes having a tapetum lucidum, which reflects any light that passes through the retina back into the eye, thereby increasing the eye's sensitivity to dim light Large pupils are an adaptation to dim light The domestic cat has slit pupils, which allow it to focus bright light without chromatic aberration At low light, a cat's pupils expand to cover most of the exposed surface of its eyes However, the domestic cat has rather poor color vision and only two types of
